Results Insights

Summary & Outlook

Corpora with semantic annotation are increasingly relevant in natural language processing

 See: Baker et al. (1998); Palmer et al. (2005); Burchardt et al. (2006); Taulé et al. (2005)

Semantic role labeling

- used for tasks such as:
  - information extraction (Surdeanu et al. 2003)
  - machine translation (Komachi et al. 2006)
  - question answering (Narayanan and Harabagiu 2004)
- requires corpora annotated with predicate-argument structure for training and testing data
  - Gildea and Jurafsky (2002); Xue and Palmer (2004); Toutanova et al. (2005); Pradhan et al. (2005), ...

Semantically-annotated corpora also have potential as sources of linguistic data for theoretical research

### Introduction & Motivation

### Background

Detecting semantic annotation errors Argument labeling variation Argument identification variation Heuristics for disambiguating etrines

#### Evaluation

Results Insights

Summary & Outlook

# Exploring semantic annotation

Need feedback on annotation schemes:

- difficult to select an underlying theory (see, e.g., Burchardt et al. 2006)
- difficult to determine certain relations, e.g., modifiers (ArgM) in PropBank (Palmer et al. 2005)

and provides an efficient algorithm to compute them.

Detecting Errors ir Semantic Annotation

Introduction & Motivation

### Background

Detecting semantic annotation errors Argument labeling variation Argument identification variation

Heuristics for disambiguating strings

#### Evaluatior

Results Insights

Summary & Outlook

### Background: the variation n-gram method Dickinson and Meurers (2003a)

Variation: material occurs multiple times in corpus with different annotations

Dickinson and Meurers (2003a) introduces the notions

- variation nucleus: recurring word with different annotation
- variation n-gram: variation nucleus with identical context

and provides an efficient algorithm to compute them.

Example: 12-gram with variation nucleus off

(1) to ward off a hostile takeover attempt by two European shipping concerns

In the two occurrences of this 12-gram in the WSJ, off is

- once annotated as a preposition (IN), and
- once as a particle (RP).

Detecting Errors in Semantic Annotation

Introduction & Motivation

### Background

Detecting semantic annotation errors Argument labeling variation Argument identification variation Heuristics for disambiguating strings

Evaluation

Result: Insight

Summary & Outlook

# Heuristics for disambigutation

Variation can result from:

- ambiguity: different possible labels occur in different corpus occurrences
- error: labeling of a string is inconsistent across comparable occurrences

Introduction & Motivation

### Background

Detecting semantic annotation errors Argument labeling variation Argument identification variation

Heuristics for disambiguating strings

Evaluation

Result: Insight

イロト イポト イヨト イヨト 二日

Summary & Outlook

# Heuristics for disambigutation

Variation can result from:

- ambiguity: different possible labels occur in different corpus occurrences
- error: labeling of a string is inconsistent across comparable occurrences

Non-fringe heuristic to detect annotation errors:

 Nuclei found at fringe of *n*-gram more likely to be genuine ambiguities (Dickinson 2005)

Question: What is the label of a nucleus?

- The argument label, e.g., Arg0?
  - Not sufficient: could have the same label, but identify arguments differently
- Include position of verb in the nucleus
  - e.g., the label of the nucleus vary widely is ArgM-MNR-0

Detecting Errors in Semantic Annotation

Introduction & Motivation

Background

Detecting semantic annotation errors

Argument labeling variation

Argument identification variation

Heuristics for disambiguating strings

Evaluation

Results

Summary & Outlook

Question: What is the label of a nucleus?

- The argument label, e.g., Arg0?
  - Not sufficient: could have the same label, but identify arguments differently
- Include position of verb in the nucleus
  - e.g., the label of the nucleus vary widely is ArgM-MNR-0

Can now find errors in argument labeling (e.g., Arg0 vs. Arg1), and in verb identification

Detecting Errors ir Semantic Annotation

# Argument identification variation

To find where an argument is unidentified or covers a different stretch of comparable text:

- assign the label NIL to a string not labeled as an argument (cf. Dickinson and Meurers 2005a)
- (3) a. [Arg1 net income in its first half] rose 59 %
  - b. [Arg1 net income] in its first half rose 8.9 %

net income in its first half rose:

- In (3a), assigned label Arg1-6
- In (3b), assigned label NIL

Insigh

Summary & Outlook

# Argument identification variation

To find where an argument is unidentified or covers a different stretch of comparable text:

- assign the label NIL to a string not labeled as an argument (cf. Dickinson and Meurers 2005a)
- (3) a. [Arg1 net income in its first half] rose 59 %
  - b. [Arg1 net income] in its first half rose 8.9 %

net income in its first half rose:

- In (3a), assigned label Arg1-6
- In (3b), assigned label NIL

NB: We also recode phrasal verbs as PV relations, to identify variation in phrasal verb identification.

Summary & Outlook

Need context to find inconsistent nuclei. Some options:

- Require no identical context of nuclei
  - → this lack of heuristic gives many false positives
- Require one word of identical context around every word in nucleus (Dickinson and Meurers 2005a)
  - → this "shortest non-fringe" heuristic is very strict

We explore another heuristic, in order to increase recall:

- The argument context heuristic requires context only around the argument
- Two main ways that something can be erroneous
  - an error in the labeling (or non-labeling) of the *argument*
  - an error in the identification of the argument

Found lower layer errors to be primary problem

Introduction & Motivation

Background

Detecting semantic annotation errors

Argument labeling variation

Argument identification variation

Heuristics for disambiguating strings

Evaluation

Insight

Summary & Outlook

# Summary and Outlook

Summary:

- Explored applying the variation *n*-gram error detection method to semantic annotation
  - Defined appropriate units of comparison
  - Relaxed the context definition, using the argument context heuristic
- Found lower layer errors to be primary problem

Outlook:

- Test on additional corpora with potentially more fine-grained labels, e.g., FrameNet
- Increase recall further (cf. Boyd et al. 2007)
- Explore using only heads of arguments for determining label, to sidestep ambiguous argument identification
  - Such a more general representation potentially more useful for identifying variation in sense annotation
