Multiply Annotated Corpora in Biomedical IE

・ロト ・回ト ・ヨト ・ヨト

Why Multiple Annotation?

- Annotated data is used to train/test IE systems
- Normally multiply annotate a sample in order to
 - Verify that humans can reliably do the task
 - Provide a measure of difficulty
 - Monitor annotation quality
- Annotation is expensive
- Need to use the budget effectively
 - How much to multiply annotate?
 - How to use multiply annotated data?
 - Reconciliation expensive too would like to avoid
- Annotator disagreement may represent real ambiguity.

(D) (A) (A) (A)

- The ITI TXM Corpora
- Two Corpora produced for TXM project
- Annotations of entities, enriched relations, normalisations
- Full papers from PubMed/PubMedCentral
- Split into TRAIN (64%), DEVTEST (16%) and TEST (20%)

| PPI | TE |
|-----------------------------|-------------------|
| Protein-protein Interaction | Tissue Expression |
| 75,000 sentences | 60,000 sentences |

Entity Annotations

| Entity type | PPI | TE |
|--------------------|--------|--------|
| CellLine | 7,676 | — |
| Complex | 7,668 | 4,033 |
| DevelopmentalStage | | 1,754 |
| Disease | | 2,432 |
| DrugCompound | 11,886 | 16,131 |
| ExperimentalMethod | 15,311 | 9,803 |
| Fragment | 13,412 | 4,466 |
| Fusion | 4,344 | 1,459 |
| GOMOP | — | 4,647 |
| Gene | — | 12,059 |
| Modification | 6,706 | _ |
| mRNAcDNA | — | 8,446 |
| Mutant | 4,829 | 1,607 |
| Protein | 88,607 | 60,782 |
| Tissue | | 36,029 |

Multiply Annotated Corpora in Biomedical IE

≣⇒

Relation Annotations

| Corpus | Relation type | Count |
|--------|---------------|--------|
| PPI | PPI | 11,523 |
| PPI | FRAG | 16,002 |
| TE | TE | 12,426 |
| TE | FRAG | 4,735 |

- PPI Protein-protein interaction relations
- TE Tissue expression relations
- FRAG Fragment/Mutant parent protein relations

Multiply Annotated Documents

| Annotations | PPI | TE |
|-------------------|-----|-----|
| Single | 125 | 150 |
| Double | 65 | 86 |
| Triple | 27 | 2 |
| Total documents | 217 | 238 |
| Total annotations | 336 | 328 |

- A sample of documents from each corpus was multiply-annotated
- Most were doubly annotated, some triply

(4月) (4日) (4日)

Inter-Annotator Agreement

| Corpus | Annotated item | IAA |
|--------|----------------|------|
| PPI | entities | 84.9 |
| PPI | relations | 76.1 |
| PPI | combined | 59.7 |
| TE | entities | 83.8 |
| TE | relations | 74.1 |
| TE | combined | 55.7 |

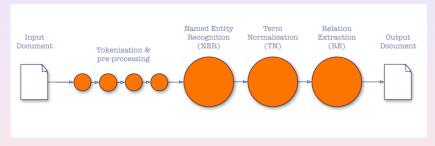

- IAA measured using F1
- Micro-averaged across document pairs
- Combined is overall IAA for relations

Named-entity Recognition (NER)

- Curran & Clark tagger: Maximum Entropy Markov Model tagger
- Extra features specifically for biomedical texts.
- Applied several biomedical gazetteers.
- Post-processing to correct boundary errors
- Detects nested entities
- Feature set optimised on DEVTEST
- Alex at al. Recognising Nested Named Entities in Biomedical Text. BioNLP 2007.

- 4 同 ト 4 ヨ ト 4 ヨ ト

Relation Extraction (RE)

- Treats each relation type separately.
- Generates candidate relations as pairs of (gold) entities.
- Maximum entropy classifier chooses "yes" or "no"
- Features derived from entities, context, pos-tags, chunks etc.
- Feature set also optimised on DEVTEST
- Haddow. Using Automated Feature Optimisation to Create an Adaptable Relation Extraction System. BioNLP 2008.

Expt 1: How to use Multiply Annotated?

- How can we best use the multiply annotations in training?
- Try different methods for obtaining one annotated document(s) from set of equivalent documents.
- Choose Training Documents:
 - all Use all documents
 - one-random Pick one at random
 - best-ner Highest ner score
 - best-re Highest re score
 - consistent Fixed annotator preference
- Combine Training Documents:
 - intersection Entities/relations in both
 - union Entities/relations in either

Train with each strategy — test on DEVTEST and TEST

・ロト ・同ト ・ヨト ・ヨト

Results - NER

| | PPI | | TE | |
|--------------|---------|------|---------|------|
| Method | DEVTEST | TEST | DEVTEST | TEST |
| all | 75.1 | 72.5 | 65.4 | 63.3 |
| one-random | 75.0 | 71.9 | 65.2 | 63.7 |
| best-ner | 74.7 | 72.1 | 64.9 | 63.5 |
| best-re | 75.1 | 72.1 | 65.1 | 63.6 |
| consistent | 74.7 | 72.4 | 65.0 | 63.6 |
| intersection | 74.8 | 72.0 | 63.9 | 62.8 |
| union | 74.8 | 72.1 | 65.1 | 63.7 |

Expt 2: Adding More Data

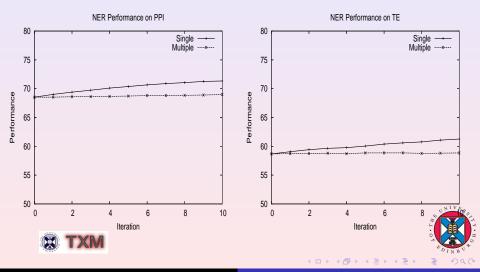

- Which gives the most rapid improvement in performance?
 - Add more singly annotated (new documents)
 - Add more multiply annotated
- \bullet Created learning curves for $_{\rm NER/RE,\ PPI/TE}$
- Started with fixed set of singly-annotated
- Added further documents in batches
 - Train/test in all configuration after each batch
- Randomise, repeat and average

向下 イヨト イヨト

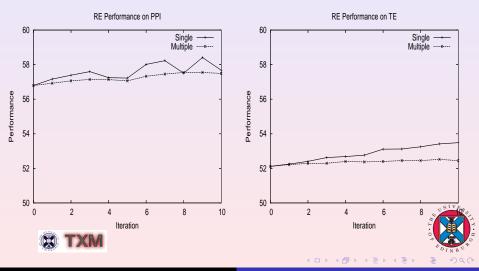

Results - NER

Multiply Annotated Corpora in Biomedical IE

Results - RE

Barry Haddow, Beatrice Alex University of Edinburgh

Multiply Annotated Corpora in Biomedical IE

Experiment 1

- Using all annotated versions tends to give better results.
- However, no significant difference in combination methods
 - No gain from adding both annotated versions, as opposed to picking one.
 - For RE, an IAA below 60 means extra information in different annotated versions
 - But large training corpus inconsistency.
 - **union** and **intersection** strategies change precision-recall balance

(4月) (1日) (1日)

- Learning curves suggest extra singly-annotated is more useful
- Just annotate enough to give good estimate of IAA
- Lots of multiple annotation probably not useful for training
